PROFILE

Mobile Developer specializing in building scalable, high-performance mobile applications using modern Android technologies. Proficient in Kotlin, Jetpack Compose, and XML-based UI development with a strong foundation in clean architecture principles. Experienced in Kotlin Multiplatform for cross-platform development. Proven track record of delivering robust applications with seamless user experiences, offline capabilities, and real-time data synchronization.

EDUCATION

Bachelor at Computer Science, Sohag University

September 2019 - July 2023

Grade: Excellent With Honor

SKILLS

Frameworks: (Android SDK with Kotlin | KMP)

UI: (Jetpack Compose | XML | Material Design 3)

Software Skills: (OOP | SOLID Principles | Data Structure | Algorithm | Design Patterns | Clean Code)

Architecture patterns: (MVVM | MVI | Android Recommended Architecture | Clean Architecture)

Local Data: (Room DB | Shared Preferences | DataStore)

Asynchronous Programming: (RxJava | Kotlin Coroutines | Kotlin Flow)

Networking: (Retrofit | Ktor Clint)

Dependency Injection: (Dagger Hilt | Koin)

Libraries: (Glide | Coil | Lottie Animation | GSON | Accompanist)

Tools: (Git | GitHub | Firebase)

PROJECTS

CarePulse (Patient Monitoring App) - Freelance Project

cross-platform (Android & iOS) patient monitoring application that used in hospitals to track real-time patient stats, vital signs, and clinical indicators. Integrated an automated MEWS/NEWS early warning scoring engine that instantly alerts medical staff upon detecting signs of clinical deterioration. Designed user-friendly features including a dynamic multi-step patient intake wizard, robust search/filtering directories, real-time alert notifications for critical vitals, and a secure administration panel for hospital staff management. Built using Kotlin Multiplatform, Compose Multiplatform, Ktor, Koin, Vico Charts, Lottie Animation.

News App • [GitHub](#)

Architected and developed a comprehensive news app using Jetpack Compose (Material Design 3) and MVI with Clean Architecture. Integrated Room for offline-first data, Retrofit with custom interceptors for API communication, and Hilt for dependency injection. Delivered features like real-time updates, offline reading, and smooth pagination in a modular and testable codebase.

Bookpedia • [GitHub](#)

a cross-platform book discovery application using Kotlin Multiplatform and Compose Multiplatform targeting Android and iOS. Leveraged Ktor Client for API communication with Open Library API,

Koin for dependency injection across platforms, and shared business logic for consistent behavior. Implemented features like book search, detailed information, and favorites with a unified codebase while maintaining platform-specific UI optimizations.

Diabetes Diagnoses (Graduation Project) • [GitHub](#)

Developed a healthcare app using ML to predict diabetes risk, assisting doctors with quick and easy diagnosis. Migrated UI from XML to Jetpack Compose for a modern interface. Used TensorFlow Lite for on-device predictions, Room for caching, and Firebase for real-time sync and authentication. Implemented offline ML inference, secure user management, and modular architecture using Hilt for dependency injection.

Chatter • [GitHub](#)

Built a feature-rich messaging app with enterprise-level architecture using Jetpack Compose and Firebase integration. Implemented custom animated UI with MVVM and repository pattern, backed by Firebase Auth and Realtime Database. Delivered real-time messaging, secure user authentication, and scalable data management.
